Punjab**

Introduction

In today's digital era, social media platforms play a major role in communication and content sharing, but many existing platforms still face issues like content theft and online harassment. These problems occur due to the lack of proper content attribution and real-time monitoring systems.

To solve these issues, **TrueVoice** will be developed as a modern social media platform. This system will allow users to create and share content, interact in real-time, and ensure content authenticity and user safety. It will provide a smooth and reliable user experience using advanced technologies.

Problem Statement

Traditional social media platforms are not fully reliable as they often fail to protect original content and provide timely moderation. This leads to problems like duplicate content without credit and abusive or excessive interactions.

Additionally, many platforms lack real-time monitoring and efficient data handling, which affects performance and user experience. Therefore, there is a need for a system that ensures content authenticity, real-time interaction, and a safe user environment.

Objectives

- To develop a real-time social media platform
- To prevent content duplication using fingerprinting
- To provide secure user authentication
- To enable user interaction through likes, comments, and follows
- To implement a shield system to prevent abusive comments
- To provide real-time notifications
- To ensure fast and efficient data handling

Methodology

The system will be developed using a full-stack approach. The frontend will be built using React.js to create an interactive and user-friendly interface. The backend will be developed using Node.js and Express.js to handle application logic efficiently.

Real-time functionality will be implemented using Socket.IO to manage notifications and live updates. MySQL will be used as the database along with Sequelize ORM for managing structured data. Content fingerprinting and safety mechanisms will be integrated to enhance system reliability.

Tools and Technologies

React.js, Node.js, Express.js, MySQL, Sequelize, Socket.IO, JWT, VS Code, Google Chrome

Expected Outcome

The system will provide users with a secure and efficient platform for sharing and interacting with content. It will reduce issues like content theft and online harassment through intelligent features and real-time monitoring.

Users will be able to create posts, interact easily, and receive real-time updates. The platform will improve user safety, content authenticity, and overall experience.

Conclusion

TrueVoice will be a modern and efficient solution for social media platforms. It will solve major issues of traditional systems by providing content protection, real-time interaction, and improved user safety.

Overall, the project aims to deliver a reliable and scalable system that enhances both user experience and platform performance.
